

SDE 3 (4–6 years, Infrastructure + Data Platform)

About the Role

What You Will Do

1. Infrastructure Platform
 - a. Design, build, and maintain scalable cloud infrastructure (AWS/GCP/Azure).
 - b. Implement Infrastructure-as-Code (IaC) using Terraform, CloudFormation, or similar tools.
 - c. Ensure reliability, observability, and security across environments.
 - d. Automate deployment, monitoring, and incident response processes.
2. Data Platform
 - a. Build robust ETL/ELT pipelines to process structured and unstructured data.
 - b. Design and optimize data models for analytics and product use cases.
 - c. Ensure data integrity, availability, and performance across systems.
 - d. Implement batch and streaming data pipelines (e.g., Kafka, Spark, Flink).
 - e. Bring strong backend engineering skills - ability to write clean, maintainable, and production-grade code (preferably in Ruby/Python/Java/Go) to support data workflows, integrations, internal services, and automation.
3. Collaboration & Delivery
 - a. Partner with product, analytics, and engineering teams to define data needs and infrastructure requirements.
 - b. Contribute to cross-functional system design discussions and architectural reviews.
 - c. Ensure delivery of reliable infrastructure and data solutions that meet SLAs.
4. Quality & Best Practices
 - a. Implement monitoring, logging, and alerting for infrastructure and pipelines.
 - b. Write automated tests for infrastructure and data transformations.
 - c. Drive adoption of best practices for cost optimization and scalability.

What You Will Need

1. 4–6 years of experience in infrastructure and/or data platform roles.
2. Strong expertise in cloud platforms (AWS, GCP, or Azure).
3. Proficiency in SQL and experience with relational/NoSQL databases.
4. Experience with data pipeline frameworks (Airflow, DBT, Spark, Flink).

5. Proficiency in at least one programming language (Python, Go, or Java).
6. Familiarity with CI/CD pipelines and containerization (Docker, Kubernetes).

Nice to Have

1. Experience with real-time data streaming (Kafka, Kinesis, Pub/Sub).
2. Exposure to data warehousing solutions (Snowflake, BigQuery, Redshift).
3. Background in security, compliance, or cost optimization of infrastructure.
4. Experience in fintech or transaction-heavy domains.
